Institutional Brief

Governance Framework and Progressive Depletion Minting Discipline

Reference Document for Ministers, Central Banks, and Senior Policy Leaders

Mann Mechanics Ltd | Institutional Engagement Office | v1.0 | April 2026

PDM is a non-discretionary supply control system. This document describes the framework, its mechanism, and the structured pathway by which institutions may evaluate it.

Executive Summary

Mann Mechanics is a governance framework built around a rules-based control discipline known as Progressive Depletion Minting (PDM). PDM replaces discretionary expansion decisions with a deterministic, auditable mechanism. The framework supports institutional credibility through structured transparency rather than narrative assurance.

PDM does not replace existing monetary, fiscal, or policy instruments. It provides a complementary control layer that institutions may adopt within parameters they themselves define. Sovereignty over those parameters rests entirely with the adopting institution. Once parameters are set, the mechanism operates within them automatically and predictably, producing a tamper-evident record of every operating cycle.

The framework is composed of three elements: the PDM mechanism itself, a three-layer licensing and certification model, and an independent public registry administered by MannCert Ltd. The structural separation between Mann Mechanics (the framework steward and licensor) and MannCert (the independent certification body) ensures that conformity assessment is not a commercial function of the rights holder.

This document is a reference for senior decision-makers evaluating whether the framework warrants further technical review. The framework is designed for jurisdictions where credibility, predictability, and transparency are strategic priorities.

Why This Framework, and Why Now

Public confidence in institutional decision-making has come under sustained pressure. The pace of monetary and fiscal intervention over the past decade has been considerable, and while much of it was necessary, the cumulative effect has been an erosion of predictability. Markets,

citizens, and international observers increasingly question not whether institutions are acting, but whether their actions are governed by clear and durable principles.

At the same time, the tools available to institutions have not kept pace with the complexity of the systems they manage. Discretionary intervention remains the dominant mode of governance, yet discretion without visible structure creates communication challenges that compound over time.

Three developments make a structured discipline particularly relevant now.

- The gap between institutional intent and public perception has widened, creating a credibility deficit that narrative assurance alone cannot close.
- Expansion dynamics across monetary, fiscal, and capacity-allocation domains have become more interconnected and faster-moving than existing frameworks were designed to govern.
- There is growing international appetite for governance innovation that strengthens accountability without imposing ideological constraints or compromising sovereignty.

Mann Mechanics was developed to address this convergence. It does not claim that existing tools are inadequate. It provides a complementary discipline for an environment that increasingly demands visible, structured, and predictable governance.

What Mann Mechanics Provides

The framework integrates three elements, each designed to reinforce the others.

Progressive Depletion Minting	Governance Framework	Public Registry
A rules-based control discipline that replaces discretionary expansion decisions with a deterministic, auditable mechanism. Institutions define the operating parameters; the mechanism then operates within them.	A structured approach enabling institutions to demonstrate accountability through measurable governance signals, distinct from conventional compliance.	A visible record of engagement and conformity status that reinforces credibility through openness. The registry is maintained by MannCert, an independent certification body separate from Mann Mechanics.

Each element can be adopted incrementally. None is mandatory. The framework respects institutional autonomy at every stage.

Progressive Depletion Minting

Mechanism Overview

Progressive Depletion Minting is a deterministic control discipline governing how supply, capacity, or issuance expands within a bounded system. Where most current approaches rely on discretionary judgement at the point of expansion, PDM establishes a measured condition under which expansion may occur and a structural resistance that increases as the system approaches its ceiling.

The mechanism operates through three components, applied in sequence on every operating cycle.

Component	Description
Continuous contraction	On every operating cycle, supply is reduced in proportion to measured system activity. Contraction is the default state. It is not an intervention. It runs always.
Conditional expansion	New supply is added only when the ratio of supply to obligations falls below a defined stability threshold. If the ratio is healthy, expansion is zero. The trigger is a measured condition, not a discretionary judgement.
Progressive resistance	When expansion does occur, the amount actually added is exponentially dampened as supply approaches the system ceiling. Each successive expansion delivers less than the one before. The system becomes structurally harder to inflate the more it has already been inflated.

The aggregate result is a system that contracts continuously, expands only when measurably depleted, and resists expansion progressively as it grows. Discretionary timing and quantity are removed. What remains is a transparent rule, observable to any party with access to the audit chain.

How It Supports Policy Objectives

From a policy perspective, PDM is best understood as a discipline that reduces reliance on ad hoc expansion decisions while preserving the institutional flexibility that policy requires. It does not prescribe outcomes. It governs the procedure by which expansion enters the system.

Specifically, the mechanism supports institutions by:

- Providing clearer expectations around expansion dynamics, both internally and to external stakeholders.
- Reinforcing credibility through adherence to predictable, transparent rules.

- Supporting long-term planning by reducing the uncertainty associated with discretionary actions.
- Offering a reference model for stress-testing, scenario analysis, and structured reform programmes.

A detailed technical specification, including the mathematical framework, simulation results, and implementation architecture, is available for institutions that wish to proceed to technical review.

What This Framework Is Not

Clarity about boundaries is as important as clarity about purpose. The framework is designed with deliberate constraints, and senior leaders should understand them at the outset.

It is not a policy prescription. PDM does not recommend, mandate, or constrain specific policy decisions. The institution defines the parameters within which the mechanism operates. Within those parameters, the mechanism is deterministic; the parameters themselves remain a matter of institutional judgement.

It is not a replacement for existing tools. The framework operates alongside current institutional mechanisms. It provides an additional control layer, not a substitute for monetary, fiscal, or regulatory instruments.

It is not a regulatory mandate. Participation is voluntary at every stage. There are no penalties, obligations, or reputational consequences for non-participation.

It is not a claim to eliminate uncertainty. No framework can remove the inherent complexity of institutional governance. PDM aims to make that complexity more navigable, more transparent, and more credible to stakeholders.

It is not aligned with any political position. The framework is structurally neutral. It focuses on the procedure of governance rather than the content of policy and is designed to operate independently of political cycles.

Conformity Assessment and Registry

Conformity assessment is a distinctive feature of the Mann Mechanics ecosystem. It is administered by MannCert Ltd, an independent certification body that operates separately from Mann Mechanics. This structural separation ensures that the entity responsible for developing and licensing the framework is not the same entity that assesses conformity to it.

Conformity assessment under MannCert verifies three things: that a deployment correctly implements the PDM mechanism as specified, that its telemetry layer satisfies the integrity requirements set out in the companion specification, and that its governance arrangements are

consistent with its stated function. A certified deployment is entitled to display the MannCert conformance mark for the duration of the certification period and is listed in the public registry.

Certification is not a perpetual grant. It is subject to periodic audit, reporting obligations, and renewal. Findings of non-conformance may result in remediation requirements, suspension of the conformance mark, or withdrawal of certification. Withdrawal of certification does not automatically terminate the underlying commercial license, but may trigger a review of license terms.

Institutional Separation

Mann Mechanics and MannCert serve distinct and complementary functions within the framework ecosystem.

Mann Mechanics	MannCert
Framework development and stewardship. Institutional engagement and advisory. Licensing for commercial implementations. Sector analysis and implementation planning.	Independent conformity assessment. Standards definition and maintenance. Public registry of conforming implementations. Enforcement, appeals, and certification withdrawal.

This separation is by design. It ensures that conformity assessments are conducted independently of commercial licensing relationships, maintaining the credibility of both functions. MannCert's certification decisions are not subject to approval by Mann Mechanics.

What Leaders Are Being Asked to Consider

This document does not request immediate adoption, operational change, or commitment of resources. At this stage, institutional leaders are asked only to consider whether the following propositions merit further exploration.

- Could a structured, rules-based expansion discipline strengthen institutional credibility in the eyes of stakeholders and the public?
- Would transparent, measurable conformity assessment reinforce trust more effectively than narrative assurance alone?
- Do predictable, rules-anchored frameworks support long-term stability and public confidence?
- Does participation in a globally visible governance initiative align with institutional objectives?

Any deeper engagement would proceed through structured technical review at a pace determined by the institution.

Policy Relevance

The framework may be relevant across a range of policy contexts.

Domain	Application
Policy communication	A rules-based discipline provides clearer signals to markets, institutions, and the public, reducing the ambiguity inherent in discretionary communication.
Reform credibility	Independent conformity assessment provides visible evidence of governance improvement, supporting the credibility of reform initiatives.
Transparency commitments	The framework offers a measurable approach to transparency that complements existing reporting and disclosure obligations.
Expansion governance	Progressive Depletion Minting provides a reference model for managing growth in monetary supply, fiscal commitments, capacity allocation, or other bounded resource systems.
Public accountability	Registry participation and conformity assessment create a durable, visible record of institutional commitment to governance standards.

Frequently Raised Questions

Does this framework affect monetary sovereignty?

No. Sovereignty is preserved at the level that matters: the institution defines the parameters within which the mechanism operates. The mechanism then enforces those parameters predictably and transparently. The institution chooses the rules; the mechanism executes them. This is the same relationship a constitutional bank has with its statutory mandate.

Is this a new policy regime?

No. PDM is a control discipline, not a policy regime. It is a mechanism that institutions may adopt within their existing policy framework. It does not impose objectives, targets, or substantive policy requirements.

What is being requested at this stage?

Only dialogue and evaluation. No commitments, operational changes, or resource allocations are assumed. The framework is presented for consideration and structured technical review if warranted.

How detailed is the underlying mechanism?

The PDM Personal Edition Whitepaper provides the formal specification of the control law, including statements and proofs of the structural invariants of the mechanism. These establish core properties such as boundedness and conditional minting. They do not claim full system optimality or universal stability, which are addressed through empirical validation and deployment-specific analysis. A companion specification, O_n as Auditable Ledger, addresses telemetry integrity. The accompanying Simulator Supporting Documentation extends the empirical analysis with a 625-point parameter stability sweep. All materials are available for technical review.

How is political neutrality maintained?

The framework operates independently of political cycles and emphasises structural principles over policy content. Conformity assessment focuses on transparency, auditability, and correct implementation, not on the substantive direction of any institution's policy.

What happens if an institution does not participate?

Nothing. There are no consequences, penalties, or reputational implications. Participation is entirely voluntary and may be initiated at any time.

What is the relationship between Mann Mechanics and MannCert?

Mann Mechanics is responsible for framework development, institutional engagement, and licensing. MannCert is a separate, independent body responsible for conformity assessment, standards maintenance, and the public registry. The two entities operate separately to ensure that the organisation licensing the framework does not also assess conformity to it.

Engagement Pathway

For institutions that wish to explore the framework further, engagement proceeds through a structured pathway. Each stage is self-contained. Institutions may pause, defer, or discontinue engagement at any point without obligation.

Stage	Format	Outcome
Initial Briefing	Structured written advisory engagement. Up to ten institutional questions analysed in writing.	Shared understanding of the framework, its relevance, and the scope of any further engagement.
Sector Analysis	Detailed analytical report examining the framework within	Comprehensive analytical document providing a structured

Stage	Format	Outcome
	a defined sector or institutional environment.	basis for internal institutional review.
Implementation Blueprint	Tailored architectural document describing how the framework could be structured within the institution.	Detailed planning document supporting internal review and governance evaluation. Does not constitute operational implementation.
Structured Partnership	Governance agreement, licensing terms, and ongoing participation framework.	Full implementation pathway agreed in writing. Conformity assessment, if pursued, conducted separately through MannCert.

Detailed terms for each stage, including fees, payment structures, and confidentiality provisions, are set out in the Mann Mechanics Institutional Engagement Fee Schedule, available on request.

Implementation Philosophy

Engagement with Mann Mechanics is designed to be gradual, exploratory, and respectful of institutional processes. There is no expectation of rapid adoption. Institutions may engage at a pace consistent with their internal review cycles and strategic priorities.

The framework emphasises collaboration over prescription. Every aspect of implementation is intended to be considered in partnership with the participating institution, ensuring alignment with local governance structures, legal frameworks, and policy objectives.

Strategic Significance

Institutions that sustain public trust over time tend to share certain characteristics: predictable behaviour, transparent governance, and a visible commitment to accountability. These qualities are not achieved through communication alone. They require structural reinforcement.

Mann Mechanics provides that structural reinforcement. By combining a rules-based expansion discipline with an independent conformity assessment regime through MannCert, it offers institutions a credible, measurable, and enduring foundation for public confidence.

The framework does not ask institutions to change what they do. It provides a discipline for demonstrating how and why they do it.

Invitation to Engage

Senior leaders, central banks, government departments, and institutional organisations are invited to explore the Mann Mechanics framework through structured dialogue.

Engagement begins with communication. No commitments are required or expected at any stage prior to formal agreement. The objective is mutual understanding and, where alignment exists, the development of a structured relationship that serves institutional and public interest.

Status and Disclaimer

Progressive Depletion Minting is covered by a pending UK patent (UKIPO GB2513172.3, filed August 2025) held by Mann Mechanics Ltd. The patent is at pending status; grant has not yet been issued. Independent conformance certification is provided by MannCert Ltd. Sector-specific performance claims are unproven in the absence of real-world deployment data and are flagged as such throughout the technical specifications.

This document is provided for institutional reference and does not constitute legal, financial, regulatory, or monetary policy advice. It does not itself constitute an offer to license or a binding commitment of any kind. Binding terms are set out in individual licence and engagement agreements executed in writing. Mann Mechanics and MannCert are separately constituted entities. Their respective functions are described above and should not be conflated.

Institutions remain solely responsible for their own evaluation, decision-making, and policy outcomes.
